Pueblo Chemical Agent-Destruction Pilot Plant

THE PROJECT

The U.S. Army Pueblo Chemical Depot in Colorado is one of the chemical weapons stockpile sites in the United States. The depot stores projectiles containing 2,611 tons of mustard agent. The Pueblo Chemical Agent-Destruction Pilot Plant will be constructed on the depot to destroy the weapons.

THE PROCESS

Neutralization followed by biotreatment is the technology selected to safely and efficiently eliminate the stockpile. The project will proceed through six stages before completion: Design, Construction, Systemization, Pilot Testing, Operation and Closure.

THE PEOPLE

Public involvement, transparency and collaboration are the cornerstones of the program. Dozens of program partners share the global vision of safe chemical weapons destruction and will work closely with the community to make that vision a reality.
