

Operation *Swift Solution*

The Program Executive Office (formerly U.S. Army Element), Assembled Chemical Weapons Alternatives (ACWA) initiated Operation *Swift Solution* in November 2007 to safely eliminate three deteriorating steel containers and wastes associated with the management of these containers that were stored at the [Blue Grass Army Depot](#) (BGAD). These steel containers were commonly referred to as “ton containers.”

The steel containers held a mixture of chemical agent GB and its breakdown products that occurred over time. One of the containers leaked in the past and the other containers showed signs of corrosion. For health and safety reasons and to prevent leaks or releases, Operation *Swift Solution* was initiated to eliminate the risks associated with the long-term storage of the containers.

ACWA coordinated the effort with the following partners: BGAD, Blue Grass Chemical Activity, U.S. Army Chemical Materials Activity (formerly Agency), U.S. Army Combat Capabilities Development Command Chemical Biological Center (formerly Edgewood Chemical Biological Center), Kentucky Department for Environmental Protection (KDEP) and local stakeholders.

Destruction began in November 2008 and progressed through three phases:

- 1) Draining and neutralization of all liquid agent from the containers.
- 2) Removal and neutralization of sludge, rust and other solids that formed over time inside the containers.
- 3) Treatment, packaging and monitoring of all solid and liquid waste. All generated waste was shipped to a permitted commercial treatment facility. A total of 1,000 gallons of GB hydrolysate was shipped from Kentucky to Veolia North America facility near Port Arthur, Texas.

After completion of Phase 3, the operational facilities were shut down and dismantled and the structures and equipment were returned to Aberdeen Proving Ground, Maryland, in April 2009.

Project personnel performed a closure certification with KDEP following the operation.
